

Hi,

Welcome to Appfront!

In this interview we will build a simulation of a sign-up flow to Appfront.

Imagine a restaurant owner gets a link to our site, and is ready to sign up. We have a fully automated signup process in which the restaurant / restaurant chain owner can sign up to Appfront and build their own branded online ordering in just a few minutes. The signup process requires the owner to add their point of sale credentials in order to pull all of the necessary information from the point of sale.

So now, it is your task to build this flow:

1. First, design a short signup flow in which a new business can sign-up by providing their details, their brand colors, pictures etc. You can use <https://excalidraw.com/> to sketch your vision.
2. Second, build a simulation of the signup flow locally using GraphQL, React, Material UI, and mongodb. The flow does not need to really connect to any 3rd parties (Point of sales, payment processing) - if you would like to add a stage of the connection - make it a dummy point of sale / payment processor.

I am here if you have any questions, or want to brainstorm together.

Behazlaha :)
